

Wall Heating

Our wall heating devices have been proven in thorough series of tests and have turned out to be a very effective and suitable heating device for a lot of reptile species! It offers a special advantage being virtually "invisible". We can integrate it either at the back or at a side panel. Visually perceptible is only a little horizontal edge. The heat is emitted wide-spread from a special plastic composite panel. Cleaning it is as easy as it is for the rest of the whole cage making the maintenance easy and effective.

A wall heating mounted on the side creates a horizontal thermal gradient from the heated to the unheated side of the cage. It adds to the effect of a spotlight or a heat panel and is mostly appropriate for animals that benefit from a massive gradient. A wall heating at the back increases the temperature in the whole cage and is the ideal supplement to a heat panel for animals for example from rain forests that benefit from a smaller gradient.

Wall heating devices add up to an optimal climate because they ensure intense air circulation! They radiate their warmth evenly into the cage also warming up the ground area in front. Many reptiles make intensive use of this feature. By spraying the substrate it can also be utilized to increase air humidity permanently.

ATTENTION! Wall heating devices are not combinable with shelves. They must not be pierced or bored through. The horizontal edge must not be used to support branches etc. The heat panel must not be covered or concealed. All heat panels come only in combination with the equivalent LHC-TP/S.
